DIVYANSHU ANAND

The Problem

When working on big projects or when multiple people work together, it can be confusing to understand why someone else made a certain design decision.

Things get even more confusing when you throw **AI** into the mix. You can tell AI to build a feature and have **ZERO** idea why AI made a certain decision

Both of these issues combined are what cause **UNMAINTAINABLE** legacy code and long-term frustration among the developers

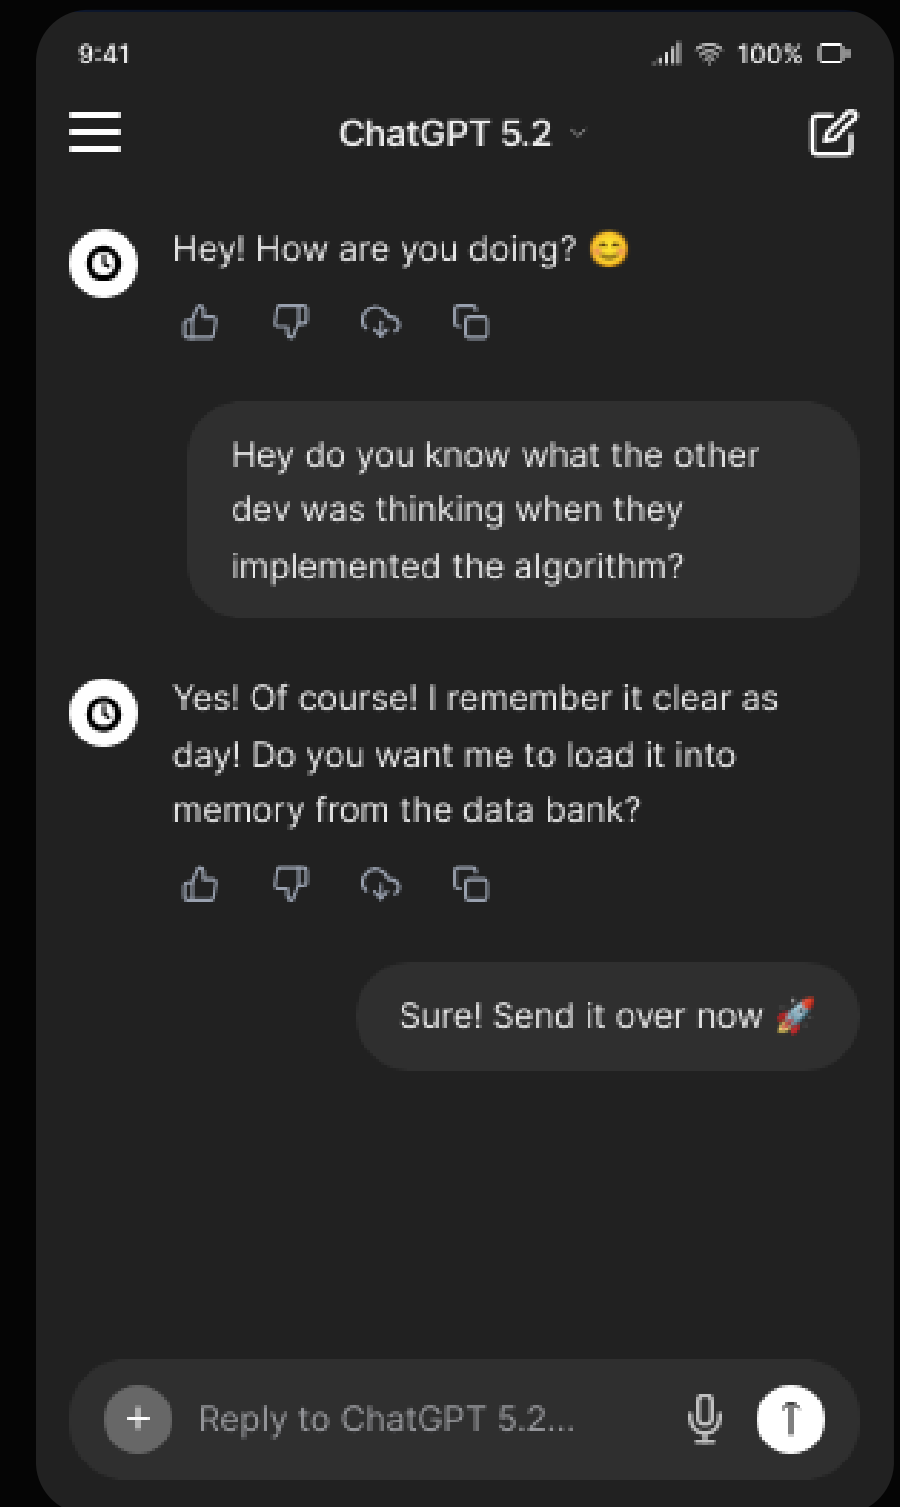

The Solution

Introducing... **LORE** !!!

Instead of just storing the final code, Lore captures the entire thought process and the history behind every architectural decision.

Native AI integration with Cline.

Lore hooks directly into Cline's thought loop. While the agent experiments, debugs, and chooses libraries, Lore intercepts its reasoning and automatically compiles a clean, structured, and shareable wiki.

WHY THIS?

Alternatives like just reading git commits or pull requests aren't always viable, since those can be as generic as 'Fixed the search algorithm' rather than a detailed report on why it was changed that way.

While Lore can figure these things out and add them to your wiki, this makes the code more maintainable.

What about code not written by AI? No problem!! Lore can infer the idea behind any developer's git commit and add it to its memory.

There are also code indexers that use AI to document the code, but they are fundamentally different from Lore. Why? because they *DON'T CAPTURE THE ENTIRE HISTORY* of how the code evolved over time.

How is Cline used?

Lore is a combination of an AI agent built on ClineSDK, an MCP server, and a set of tools designed for use by Cline.

Our Target Audience includes everyone from Solo Hobby Devs to Large Corporations to Open-Source Maintainers.

The MVP will include a fully functional CLine Plugin with all the features mentioned earlier, a tool called Mechanism to pull data from the local wiki and share it with other contributors, and much more!!!

THANK
YOU.
